

## Seeding Instructions for SAM's Wildlife Mix

Because SAM's Wildlife Mix contains similar-sized, generally small seed, a little seed goes a long way. Hence, recommended seeding rates are lower than for mixes with seeds ranging from peas to brassicas.

This mix can be sown from May to late August; the earlier the better. It can also be frost seeded.

For **broadcast seeding** using a Cyclone hand seeder or ATV, calibrate your seeder to sow at **40 to 50 lbs/acre.**

When using a **grain drill**, sow at a rate of **25 lbs./ acre.**

**Frost seeding** will require higher application rates. Use **75 lbs/ acre.**

Germination will be better if the site has been dragged or tracked to expose mineral soil.

Light dragging or tracking after sowing is recommended to cover seed.

Use shredded hay mulch sparingly, if at all.

Incorporation of soil amendments to improve soil fertility and Ph, though desirable, is optional for stand establishment.
